Hi, I'm Elliot! I'm an architect turned building scientist turned information scientist. I guess that makes me part designer, part scientist, and part engineer.

A California native, I studied architecture in college. After college, I worked as an architect, and later a construction cost estimator. While I worked in the building industry, I developed a strong desire to make the built environment a more **sustainable** place. In pursuit of this goal, I began a MS program in Building Science believing that research and knowledge is key in implementing change.

While in grad school, I became interested in building energy dashboards and how information, when presented thoughtfully, can influence people's behavior and act to conserve resources. This interest served me later as I applied my broad set of skills working at a non-profit, the Institute for the Sustainable Performance of Buildings (Superb). At Superb, I aided in the development of educational software intended to teach building professionals the basics of high performance buildings.

My interest in information visualization and experience developing educational software then led me to the **I School** where I have found my calling in User Experience design.

The process of UX design resonates with me. In architectural design, the emphasis is more often than not about space and voids, guided by the architect's own hubris, rather than a clear focus on the user's needs. As someone who wanted to design things for people, the architect's focus was counter-intuitive. I'm glad to finally be in a place where others share similar perspectives on design.

PROJECTS:

LockerX: A CrossFit App

Energy Plus Simulation Viewer

LOCKERX: A CROSSFIT PROGRAMMING AND TRACKING APP SPRING 2012

KEYWORDS: USER RESEARCH, RAPID PROTOTYPING, JAVASCRIPT, JQUERY, DJANGO, D3.JS

Website Programming Page

FINAL WEBSITE, BALSAMIQ MOCKUP

Team: Andrew Chao, Gilbert Hernandez, Laura Wishingrad, Taeil Kwak

CrossFit is a fitness routine which combines multiple other fitness styles. Some key aspects of CrossFit is that the workout routines change daily and there is a focus on tracking individual progress.

The goal of this project was to extend the CrossFit community such that coaches and members can have a better platform for interaction. In particular, we:

- o Created a tool for coaches to program workouts
- o Provided a simple way for members to record their performance
- o Displayed performance data in a compelling, visual way

POLE AERIAL PHOTOGRAPHY RIG Summer 2010

Keywords: Arduino, xbee, Prototyping

I am a tinkerer. I am also a photographer. This is a personal project which combines both.

Inspired by my former professor, Cris Benton, I've wanted to get into aerial photography for some time. Unfortunately, kite aerial photography has a high barrier for entry for someone who has never flown a kite. But pole aerial photography seemed much easier.

I bought a 9.5 meter long carbon fiber margin pole—typically used for fishing in the UK. I then built a rig to attach my camera and designed a device to remotely fire the shutter.

To fire the camera, I have two parts: one on the ground and one on the camera. Attached to the camera is an Arduino mini, connected to an xbee radio transmitter and a servo motor which physically presses the camera shutter button. On the ground is a remote with a button connected to another xbee radio transmitter. When the button is pressed, the signal is transmitted to the Arduino which then actuates the server. An LED indicates
